Rocky Enterprise Linux 9.2 Manual Pages on command 'installkernel.8'

$ man installkernel.8

INSTALLKERNEL(8)   System Manager's Manual   INSTALLKERNEL(8)

NAME

    installkernel - tool to script kernel installation

SYNOPSIS

    installkernel <kernel-version> <bootimage> <mapfile>

DESCRIPTION

    installkernel installs a new kernel image onto the system from the

    Linux source tree. It is called by the Linux kernel makefiles when make

    install is invoked there.

    The new kernel is installed into {directory}/vmlinuz-{version}. If a

    symbolic link {directory}/vmlinuz already exists, it is refreshed by

    making a link from {directory}/vmlinuz to the new kernel, and the pre?

    viously installed kernel is available as {directory}/vmlinuz.old.
