\$ man mysql_ssl_rsa_setup.1

MYSQL_SSL_RSA_SETUP(1)

MySQL Database System MYSQL_SSL_RSA_SETUP(1)

NAME

mysql_ssl_rsa_setup - create SSL/RSA files

SYNOPSIS

mysql_ssl_rsa_setup [options]

DESCRIPTION

Note

mysql_ssl_rsa_setup is deprecated as of MySQL 8.0.34. Instead,

consider using MySQL server to generate missing SSL and RSA files

automatically at startup (see the section called ?Automatic SSL and

RSA File Generation?).

This program creates the SSL certificate and key files and RSA key-pair files required to support secure connections using SSL and secure password exchange using RSA over unencrypted connections, if those files are missing. mysql_ssl_rsa_setup can also be used to create new SSL files if the existing ones have expired.

Note

mysql_ssl_rsa_setup uses the openssl command, so its use is

contingent on having OpenSSL installed on your machine. Another way to generate SSL and RSA files, for MySQL distributions compiled using OpenSSL, is to have the server generate them automatically. See Section 6.3.3.1, ?Creating SSL and RSA Certificates and Keys using MySQL?. Important mysql_ssl_rsa_setup helps lower the barrier to using SSL by making it easier to generate the required files. However, certificates generated by mysql_ssl_rsa_setup are self-signed, which is not very secure. After you gain experience using the files created by mysql_ssl_rsa_setup, consider obtaining a CA certificate from a registered certificate authority.

Invoke mysql_ssl_rsa_setup like this:

mysql_ssl_rsa_setup [options]

Typical options are --datadir to specify where to create the files, and --verbose to see the openssl commands that mysql_ssl_rsa_setup executes.

mysql_ssl_rsa_setup attempts to create SSL and RSA files using a default set of file names. It works as follows:

 mysql_ssl_rsa_setup checks for the openssl binary at the locations specified by the PATH environment variable. If openssl is not found, mysql_ssl_rsa_setup does nothing. If openssl is present, mysql_ssl_rsa_setup looks for default SSL and RSA files in the MySQL data directory specified by the --datadir option, or the compiled-in data directory if the --datadir option is not given.

mysql_ssl_rsa_setup checks the data directory for SSL files with the following names:

ca.pem

server-cert.pem

server-key.pem

 If any of those files are present, mysql_ssl_rsa_setup creates no SSL files. Otherwise, it invokes openssl to create them, plus some additional files:

ca.pem	Self-signed CA certificate
ca-key.pem	CA private key
server-cert.pem	Server certificate
server-key.pem	Server private key
client-cert.pem	Client certificate
client-key.pem	Client private key

These files enable secure client connections using SSL; see Section 6.3.1, ?Configuring MySQL to Use Encrypted Connections?.

 mysql_ssl_rsa_setup checks the data directory for RSA files with the following names:

private_key.pem	Private member of private/public key pair
public_key.pem	Public member of private/public key pair

5. If any of these files are present, mysql_ssl_rsa_setup creates no RSA files. Otherwise, it invokes openssl to create them. These files enable secure password exchange using RSA over unencrypted connections for accounts authenticated by the sha256_password or caching_sha2_password plugin; see Section 6.4.1.3, ?SHA-256 Pluggable Authentication?, and Section 6.4.1.2, ?Caching SHA-2 Pluggable Authentication?.

For information about the characteristics of files created by mysql_ssl_rsa_setup, see Section 6.3.3.1, ?Creating SSL and RSA Certificates and Keys using MySQL?. At startup, the MySQL server automatically uses the SSL files created by mysql_ssl_rsa_setup to enable SSL if no explicit SSL options are given other than --ssl (possibly along with ssl_cipher). If you prefer to designate the files explicitly, invoke clients with the --ssl-ca, --ssl-cert, and --ssl-key options at startup to name the ca.pem, server-cert.pem, and server-key.pem files, respectively.

The server also automatically uses the RSA files created by

mysql_ssl_rsa_setup to enable RSA if no explicit RSA options are given.

If the server is SSL-enabled, clients use SSL by default for the

connection. To specify certificate and key files explicitly, use the

--ssl-ca, --ssl-cert, and --ssl-key options to name the ca.pem,

client-cert.pem, and client-key.pem files, respectively. However, some additional client setup may be required first because mysql_ssl_rsa_setup by default creates those files in the data directory. The permissions for the data directory normally enable access only to the system account that runs the MySQL server, so client programs cannot use files located there. To make the files available, copy them to a directory that is readable (but not writable) by clients:

? For local clients, the MySQL installation directory can be used. For example, if the data directory is a subdirectory of the installation directory and your current location is the data directory, you can copy the files like this:

cp ca.pem client-cert.pem client-key.pem ..

? For remote clients, distribute the files using a secure channel to ensure they are not tampered with during transit.

If the SSL files used for a MySQL installation have expired, you can

use mysql_ssl_rsa_setup to create new ones:

1. Stop the server.

- Rename or remove the existing SSL files. You may wish to make a backup of them first. (The RSA files do not expire, so you need not remove them. mysql_ssl_rsa_setup can see that they exist and does not overwrite them.)
- 3. Run mysql_ssl_rsa_setup with the --datadir option to specify where to create the new files.
- 4. Restart the server.

mysql_ssl_rsa_setup supports the following command-line options, which can be specified on the command line or in the [mysql_ssl_rsa_setup] and [mysqld] groups of an option file. For information about option files used by MySQL programs, see Section 4.2.2.2, ?Using Option Files?.

- ? --help, ? Display a help message and exit.
- ? --datadir=dir_name The path to the directory that

mysql_ssl_rsa_setup should check for default SSL and RSA files and

in which it should create files if they are missing. The default is the compiled-in data directory.

- ? --suffix=str The suffix for the Common Name attribute in X.509 certificates. The suffix value is limited to 17 characters. The default is based on the MySQL version number.
- ? --uid=name, -v The name of the user who should be the owner of any created files. The value is a user name, not a numeric user ID. In the absence of this option, files created by mysql_ssl_rsa_setup are owned by the user who executes it. This option is valid only if you execute the program as root on a system that supports the chown() system call.
- ? --verbose, -v Verbose mode. Produce more output about what the program does. For example, the program shows the openssl commands it runs, and produces output to indicate whether it skips SSL or RSA file creation because some default file already exists.
- ? --version, -V Display version information and exit.
