Rocky Enterprise Linux 9.2 Manual Pages on command 'podman-container-mount.1'

$ man podman-container-mount.1

podman-mount(1)   General Commands Manual   podman-mount(1)

NAME

   podman-mount - Mount a working container's root filesystem

SYNOPSIS

   podman mount [options] [container ...]

   podman container mount [options] [container ...]

DESCRIPTION

   Mounts the specified containers' root file system in a location which

   can be accessed from the host, and returns its location.

   Podman lists all of the currently mounted containers, including exter?

   nal containers, when the command is executed without any arguments. Ex?

   ternal containers are containers in container/storage by tools other

   than Podman. For example Buildah and CRI-O.

   Rootless mode only supports mounting VFS driver, unless Podman is run

   within the user namespace via the podman unshare command. All other

   storage drivers will fail to mount.

RETURN VALUE

   The location of the mounted file system. On error an empty string and

errno is returned.

OPTIONS

--all, -a

Mount all podman containers. (External containers will not be mounted)

--format=format

Print the mounted containers in specified format (json).

--latest, -l

Instead of providing the container name or ID, use the last created

container.   Note: the last started container could be from other users

of Podman on the host machine. (This option is not available with the

remote Podman client, including Mac and Windows (excluding WSL2) ma?

chines)

--no-trunc

Do not truncate the output (default false).

EXAMPLE

podman mount c831414b10a3

/var/lib/containers/storage/overlay/f3ac502d97b5681989dff84dfedc8354239bcecbdc2692f9a639f4e080a02364/merged

podman mount

c831414b10a3

/var/lib/containers/storage/overlay/f3ac502d97b5681989dff84dfedc8354239bcecbdc2692f9a639f4e080a02364/merged
