$ man podman-pod-start.1

podman-pod-start(1)   General Commands Manual   podman-pod-start(1)

NAME

    podman-pod-start - Start one or more pods

SYNOPSIS

    podman pod start [options] pod ...

DESCRIPTION

    Start containers in one or more pods. You may use pod IDs or names as

    input. The pod must have a container attached to be started.

OPTIONS

  --all, -a

    Starts all pods

  --latest, -l

    Instead of providing the pod name or ID, use the last created pod.

    Note: the last started pod could be from other users of Podman on the

    host machine. (This option is not available with the remote Podman

    client, including Mac and Windows (excluding WSL2) machines)

  --pod-id-file=file

    Read pod ID from the specified file and start the pod. Can be specified

multiple times.

EXAMPLE

Start pod with a given name

    podman pod start mywebserverpod

Start pods with given IDs

    podman pod start 860a4b23 5421ab4

Start the latest pod created by Podman

    podman pod start --latest

Start all pods

    podman pod start --all

Start pod using ID specified in a given file

    podman pod start --pod-id-file /path/to/id/file
