$ man rmiregistry-java-11-openjdk-11.0.20.0.8-3.el9.x86_64.1

rmiregistry(1)   Remote Method Invocation (RMI) Tools   rmiregistry(1)

NAME

    rmiregistry - Starts a remote object registry on the specified port on

    the current host.

SYNOPSIS

    rmiregistry [port]

    port   The number of a port on the current host at which to start the

        remote object registry.

DESCRIPTION

    The rmiregistry command creates and starts a remote object registry on

    the specified port on the current host. If the port is omitted, then

    the registry is started on port 1099. The rmiregistry command produces

    no output and is typically run in the background, for example:

    rmiregistry &

    A remote object registry is a bootstrap naming service that is used by

    RMI servers on the same host to bind remote objects to names. Clients

    on local and remote hosts can then look up remote objects and make

    remote method invocations.

The registry is typically used to locate the first remote object on

which an application needs to call methods. That object then provides

application-specific support for finding other objects.

The methods of the java.rmi.registry.LocateRegistry class are used to

get a registry operating on the local host or local host and port.

The URL-based methods of the java.rmi.Naming class operate on a

registry and can be used to look up a remote object on any host and on

the local host. Bind a simple name (string) to a remote object, rebind

a new name to a remote object (overriding the old binding), unbind a

remote object, and list the URL bound in the registry.

OPTIONS

-J

Used with any Java option to pass the option following the -J

(no spaces between the -J and the option) to the Java

interpreter.
