Rocky Enterprise Linux 9.2 Manual Pages on command 'setsebool.8'

$ man setsebool.8

setsebool(8)   SELinux Command Line documentation   setsebool(8)

NAME

    setsebool - set SELinux boolean value

SYNOPSIS

    setsebool [-PNV] boolean value | bool1=val1 bool2=val2 ...

DESCRIPTION

    setsebool sets the current state of a particular SELinux boolean or a

    list of booleans to a given value. The value may be 1 or true or on to

    enable the boolean, or 0 or false or off to disable it.

    Without the -P option, only the current boolean value is affected; the

    boot-time default settings are not changed.

    If the -P option is given, all pending values are written to the policy

    file on disk. So they will be persistent across reboots.

    If the -N option is given, the policy on disk is not reloaded into the

    kernel.

    If the -V option is given, verbose error messages will be printed from

    semanage libraries.
