NAME

       Test::Lintian::Build −− routines to prepare the work directories

SYNOPSIS

```
use Test::Lintian::Build qw(build_subject);
```

DESCRIPTION

       The routines in this module prepare the work directories in which the tests are run. To do so, they use the specifications in the test set.

FUNCTIONS

       build_subject(PATH)

              Populates a work directory RUN_PATH with data from the test located in SPEC_PATH. The optional parameter REBUILD forces a rebuild if true.
