Linux Ubuntu 26.04 Manual Pages on command 'exec.3'

$ man exec.3

exec(3) Library Functions Manual exec(3)

NAME

execl, execlp, execle, execv, execvp, execvpe - execute a file

LIBRARY

Standard C library (libc, -lc)

SYNOPSIS

```
#include <unistd.h>

extern char **environ;

int execl(const char *path, const char *arg, ...
          /*, (char *) NULL */);

int execlp(const char *file, const char *arg, ...
          /*, (char *) NULL */);

int execle(const char *path, const char *arg, ...
          /*, (char *) NULL, char *const envp[] */);

int execv(const char *path, char *const argv[]);

int execvp(const char *file, char *const argv[]);

int execvpe(const char *file, char *const argv[], char *const envp[]);
```

Feature Test Macro Requirements for glibc (see feature_test_macros(7)):

execvpe():

_GNU_SOURCE

DESCRIPTION

The exec() family of functions replaces the current process image with a new process image.

The functions described in this manual page are layered on top of execve(2). (See the man?

ual page for execve(2) for further details about the replacement of the current process im?
age.)

The initial argument for these functions is the name of a file that is to be executed.

The functions can be grouped based on the letters following the "exec" prefix.

l - execl(), execlp(), execle()

The const char *arg and subsequent ellipses can be thought of as arg0, arg1, ..., argn. To?
gether they describe a list of one or more pointers to null-terminated strings that repre?
sent the argument list available to the executed program. The first argument, by conven?
tion, should point to the filename associated with the file being executed. The list of ar?
guments must be terminated by a null pointer, and, since these are variadic functions, this
pointer must be cast (char *) NULL.

By contrast with the 'l' functions, the 'v' functions (below) specify the command-line argu?
ments of the executed program as a vector.

v - execv(), execvp(), execvpe()

The char *const argv[] argument is an array of pointers to null-terminated strings that rep?
resent the argument list available to the new program. The first argument, by convention,
should point to the filename associated with the file being executed. The array of pointers
must be terminated by a null pointer.

e - execle(), execvpe()

The environment of the new process image is specified via the argument envp. The envp argu?
ment is an array of pointers to null-terminated strings and must be terminated by a null
pointer.

All other exec() functions (which do not include 'e' in the suffix) take the environment for
the new process image from the external variable environ in the calling process.

p - execlp(), execvp(), execvpe()

These functions duplicate the actions of the shell in searching for an executable file if
the specified filename does not contain a slash (/) character. The file is sought in the
colon-separated list of directory pathnames specified in the PATH environment variable. If
this variable isn't defined, the path list defaults to a list that includes the directories
returned by confstr(_CS_PATH) (which typically returns the value "/bin:/usr/bin") and possi?
bly also the current working directory; see VERSIONS for further details.

execvpe() searches for the program using the value of PATH from the caller's environment,
not from the envp argument.

If the specified filename includes a slash character, then PATH is ignored, and the file at the specified pathname is executed.

In addition, certain errors are treated specially.

If permission is denied for a file (the attempted execve(2) failed with the error EACCES), these functions will continue searching the rest of the search path. If no other file is found, however, they will return with errno set to EACCES.

If the header of a file isn't recognized (the attempted execve(2) failed with the error ENOEXEC), these functions will execute the shell (/bin/sh) with the path of the file as its first argument. (If this attempt fails, no further searching is done.)

All other exec() functions (which do not include 'p' in the suffix) take as their first ar? gument a (relative or absolute) pathname that identifies the program to be executed.

RETURN VALUE

The exec() functions return only if an error has occurred. The return value is -1, and er? rno is set to indicate the error.

ERRORS

All of these functions may fail and set errno for any of the errors specified for execve(2).

ATTRIBUTES

For an explanation of the terms used in this section, see attributes(7).

Interface	Attribute	Value
execl(), execle(), execv()	Thread safety	MT-Safe
execlp(), execvp(), execvpe()	Thread safety	MT-Safe env

VERSIONS

The default search path (used when the environment does not contain the variable PATH) shows some variation across systems. It generally includes /bin and /usr/bin (in that order) and may also include the current working directory. On some other systems, the current working is included after /bin and /usr/bin, as an anti-Trojan-horse measure. The glibc implementa? tion long followed the traditional default where the current working directory is included at the start of the search path. However, some code refactoring during the development of glibc 2.24 caused the current working directory to be dropped altogether from the default

search path. This accidental behavior change is considered mildly beneficial, and won't be reverted.

The behavior of execlp() and execvp() when errors occur while attempting to execute the file is historic practice, but has not traditionally been documented and is not specified by the POSIX standard. BSD (and possibly other systems) do an automatic sleep and retry if ETXTBSY is encountered. Linux treats it as a hard error and returns immediately.

Traditionally, the functions execlp() and execvp() ignored all errors except for the ones described above and ENOMEM and E2BIG, upon which they returned. They now return if any er? ror other than the ones described above occurs.

STANDARDS

environ

execl()

execlp()

execle()

execv()

execvp()

POSIX.1-2008.

execvpe()

GNU.

HISTORY

environ

execl()

execlp()

execle()

execv()

execvp()

POSIX.1-2001.

execvpe()

glibc 2.11.

BUGS

Before glibc 2.24, execl() and execle() employed realloc(3) internally and were consequently not async-signal-safe, in violation of the requirements of POSIX.1. This was fixed in glibc 2.24.

Architecture-specific details

On sparc and sparc64, execv() is provided as a system call by the kernel (with the prototype shown above) for compatibility with SunOS. This function is not employed by the execv() wrapper function on those architectures.
