

Linux Ubuntu 26.04 Manual Pages on command 'fincore.1'

\$ man fincore.1

FINCORE(1) User Commands FINCORE(1)

NAME

fincore - count pages of file contents in core

SYNOPSIS

fincore [options] file...

DESCRIPTION

fincore counts pages of file contents being resident in memory (in core), and reports the numbers. If an error occurs during counting, then an error message is printed to the stderr and fincore continues processing the rest of files listed in a command line.

The default output is subject to change. So whenever possible, you should avoid using default outputs in your scripts. Always explicitly define expected columns by using --output columns-list in environments where a stable output is required.

OPTIONS

-n, --noheadings

Do not print a header line in status output.

-b, --bytes

Print the sizes in bytes rather than in a human-readable format.

By default, the unit, sizes are expressed in, is byte, and unit prefixes are in power of 2^{10} (1024). Abbreviations of symbols are exhibited truncated in order to reach a better readability, by exhibiting alone the first letter of them; examples: "1 KiB" and "1 MiB" are respectively exhibited as "1 K" and "1 M", then omitting on purpose the mention "iB", which is part of these abbreviations.

-o, --output list

Define output columns. See the --help output to get a list of the currently supported columns. The default list of columns may be extended if list is specified in the format +list.

--output-all

Output all available columns.

-r, --raw

Produce output in raw format. All potentially unsafe characters are hex-escaped (\x<code>).

-J, --json

Use JSON output format.

-h, --help

Display help text and exit.

-V, --version

Display version and exit.
