

Linux Ubuntu 26.04 Manual Pages on command 'git-credential-cache--daemon.1'

\$ man git-credential-cache--daemon.1

GIT-CREDENTIAL-CACHE--DAEMON(1) Git Manual GIT-CREDENTIAL-CACHE--DAEMON(1)

NAME

git-credential-cache--daemon - Temporarily store user credentials in memory

SYNOPSIS

git credential-cache--daemon [--debug] <socket-path>

DESCRIPTION

Note

You probably don't want to invoke this command yourself; it is started automatically when you use git-credential-cache(1).

This command listens on the Unix domain socket specified by <socket-path> for git-credential-cache clients. Clients may store and retrieve credentials. Each credential is held for a timeout specified by the client; once no credentials are held, the daemon exits.

If the --debug option is specified, the daemon does not close its stderr stream, and may output extra diagnostics to it even after it has begun listening for clients.
