Git Manual

GIT-MKTREE(1)

NAME

git-mktree - Build a tree-object from ls-tree formatted text

SYNOPSIS

git mktree [-z] [--missing] [--batch]

DESCRIPTION

Reads standard input in non-recursive ls-tree output format, and creates a tree object. The order of the tree entries is normalized by mktree so pre-sorting the input is not required. The object name of the tree object built is written to the standard output.

OPTIONS

-z

Read the NUL-terminated ls-tree -z output instead.

--missing

Allow missing objects. The default behaviour (without this option) is to verify that each tree entry's hash identifies an existing object. This option has no effect on the treatment of gitlink entries (aka "submodules") which are always allowed to be missing.

--batch

Allow building of more than one tree object before exiting. Each tree is separated by a single blank line. The final newline is optional. Note - if the -z option is used, lines are terminated with NUL.
