

Linux Ubuntu 26.04 Manual Pages on command 'git-whatchanged.1'

\$ man git-whatchanged.1

GIT-WHATCHANGED(1)

Git Manual

GIT-WHATCHANGED(1)

NAME

git-whatchanged - Show logs with differences each commit introduces

SYNOPSIS

git whatchanged <option>...

WARNING

git whatchanged has been deprecated and is scheduled for removal in a future version of Git,
as it is merely git log with different defaults.

DESCRIPTION

Shows commit logs and diff output each commit introduces.

New users are encouraged to use git-log(1) instead. The whatchanged command is essentially
the same as git-log(1) but defaults to showing the raw format diff output and skipping
merges:

git log --raw --no-merges

The command is primarily kept for historical reasons; fingers of many people who learned Git
long before git log was invented by reading the Linux kernel mailing list are trained to
type it.

EXAMPLES

git whatchanged -p v2.6.12.. include/scsi drivers/scsi

Show as patches the commits since version v2.6.12 that changed any file in the
include/scsi or drivers/scsi subdirectories

git whatchanged --since="2 weeks ago" -- gitk

Show the changes during the last two weeks to the file gitk. The "--" is necessary to

avoid confusion with the branch named gitk

GIT

Part of the git(1) suite

Git 2.53.0
