\$ man libnetlink.3

libnetlink(3) Library Functions Manual libnetlink(3)

NAME

libnetlink - A library for accessing the netlink service

SYNOPSIS

```
#include <asm/types.h>

#include <libnetlink.h>

#include <linux/netlink.h>

#include <linux/rtnetlink.h>

int rtnl_open(struct rtnl_handle *rth, unsigned subscriptions)

int rtnl_wilddump_request(struct rtnl_handle *rth, int family, int type)

int rtnl_send(struct rtnl_handle *rth, char *buf, int len)

int rtnl_dump_request(struct rtnl_handle *rth, int type, void *req, int len)

int rtnl_dump_filter(struct rtnl_handle *rth,

    int (*filter)(struct sockaddr_nl *, struct nlmsgghdr *n, void *),

    void *arg1,

    int (*junk)(struct sockaddr_nl *, struct nlmsgghdr *n, void *),

    void *arg2)

int rtnl_talk(struct rtnl_handle *rtnl, struct nlmsgghdr *n, pid_t peer,

    unsigned groups, struct nlmsgghdr *answer,

    int (*junk)(struct sockaddr_nl *, struct nlmsgghdr *n, void *),

    void *jarg)

int rtnl_listen(struct rtnl_handle *rtnl,

    int (*handler)(struct sockaddr_nl *, struct rtnl_ctrl_data *,
```

```

        struct nlmsg_hdr *n, void *),

        void *jarg)

int rtnl_from_file(FILE *rtnl,

        int (*handler)(struct sockaddr_nl *, struct nlmsg_hdr *n, void *),

        void *jarg)

int addattr32(struct nlmsg_hdr *n, int maxlen, int type, __u32 data)

int addattr_l(struct nlmsg_hdr *n, int maxlen, int type, void *data, int alen)

int rta_addattr32(struct rtattr *rta, int maxlen, int type, __u32 data)

int rta_addattr_l(struct rtattr *rta, int maxlen, int type, void *data, int alen)

```

DESCRIPTION

libnetlink provides a higher level interface to rtnetlink(7). The read functions return 0 on success and a negative errno on failure. The send functions return the amount of data sent, or -1 on error.

rtnl_open

Open a rtnetlink socket and save the state into the rth handle. This handle is passed to all subsequent calls. subscriptions is a bitmap of the rtnetlink multicast groups the socket will be a member of.

rtnl_wilddump_request

Request a full dump of the type database for family addresses. type is a rtnetlink message type.

rtnl_dump_request

Request a full dump of the type data buffer into buf with maximum length of len. type is a rtnetlink message type.

rtnl_dump_filter

Receive netlink data after a request and filter it. The filter callback checks if the received message is wanted. It gets the source address of the message, the message itself and arg1 as arguments. 0 as return means that the filter passed, a negative value is returned by rtnl_dump_filter in case of error. NULL for filter means to not use a filter. junk is used to filter messages not destined to the local socket. Only one message bundle is received. If there is a message pending, this function does not block.

rtnl_listen

Receive netlink data after a request and pass it to handler. handler is a callback

that gets the message source address, ancillary data, the message itself, and the jarg cookie as arguments. It will get called for all received messages. Only one message bundle is received. If there is a message pending this function does not block.

`rtnl_from_file`

Works like `rtnl_listen`, but reads a netlink message bundle from the file `file` and passes the messages to handler for parsing. The file should contain raw data as received from a rtnetlink socket.

The following functions are useful to construct custom rtnetlink messages. For simple data? base dumping with filtering it is better to use the higher level functions above. See `rt?netlink(3)` and `netlink(3)` on how to generate a rtnetlink message. The following utility functions require a continuous buffer that already contains a netlink message header and a rtnetlink request.

`rtnl_send`

Send the rtnetlink message in buf of length len to handle rth.

`addattr32`

Add a `__u32` attribute of type `type` and with value `data` to netlink message `n`, which is part of a buffer of length `maxlen`.

`addattr_l`

Add a variable length attribute of type `type` and with value `data` and `alen` length to netlink message `n`, which is part of a buffer of length `maxlen`. `data` is copied.

`rta_addattr32`

Initialize the rtnetlink attribute `rta` with a `__u32` data value.

`rta_addattr32`

Initialize the rtnetlink attribute `rta` with a variable length data value.

BUGS

This library is meant for internal use, use `libmnl` for new programs.

The functions sometimes use `fprintf` and `exit` when a fatal error occurs. This library should be named `librtnetlink`.

AUTHORS

`netlink/rtnetlink` was designed and written by Alexey Kuznetsov. Andi Kleen wrote the man page.
