

## Linux Ubuntu 26.04 Manual Pages on command 'lxdm.1'

### \$ man lxdm.1

lxdm(1)                      General Commands Manual                      lxdm(1)

#### NAME

lxdm - locale-sensitive wrapper for xterm

#### SYNOPSIS

lxdm [ xterm-options ]

#### DESCRIPTION

lxdm is a wrapper around the xterm(1) program that invokes xterm, koi8rxterm(1), or uxterm(1) as appropriate, based on the user's locale setting. All arguments to lxdm are passed to xterm without processing; the -class, -k8, and -u8 options should not be specified because they are used by koi8rxterm and uxterm. See the xterm manual page for more information on xterm-options.

The locale(1) utility is used to determine the character set used by the current locale. If the character set is UTF-8, uxterm is invoked; if the character set is KOI8-R, koi8rxterm is invoked; otherwise, ?plain? xterm is invoked.
