\$ man npm-owner.1

NPM-OWNER(1)

General Commands Manual

NPM-OWNER(1)

NAME

npm-owner

Synopsis

<!-- AUTOGENERATED USAGE DESCRIPTIONS -->

Note: This command is unaware of workspaces.

Description

Manage ownership of published packages.

? ls: List all the users who have access to modify a package and push new versions. Handy when you need to know who to bug for help.

? add: Add a new user as a maintainer of a package. This user is enabled to modify metadata, publish new versions, and add other owners.

? rm: Remove a user from the package owner list. This immediately revokes their privileges.

Note that there is only one level of access. Either you can modify a package, or you can't. Future versions may contain more fine-grained access levels, but that is not implemented at this time.

If you have two-factor authentication enabled with auth-and-writes (see npm-profile) then you'll need to include an otp on the command line when changing ownership with --otp.
