

Linux Ubuntu 26.04 Manual Pages on command 'npm-pack.1'

\$ man npm-pack.1

NPM-PACK(1) General Commands Manual NPM-PACK(1)

NAME

npm-pack

Synopsis

<!-- AUTOGENERATED USAGE DESCRIPTIONS -->

Configuration

<!-- AUTOGENERATED CONFIG DESCRIPTIONS -->

Description

For anything that's installable (that is, a package folder, tarball, tarball url, git url, name@tag, name@version, name, or scoped name), this command will fetch it to the cache, copy the tarball to the current working directory as <name>-<version>.tgz, and then write the filenames out to stdout.

If the same package is specified multiple times, then the file will be overwritten the second time.

If no arguments are supplied, then npm packs the current package folder.
