

Linux Ubuntu 26.04 Manual Pages on command 'npm-unpublish.1'

\$ man npm-unpublish.1

NPM-UNPUBLISH(1)

General Commands Manual

NPM-UNPUBLISH(1)

NAME

npm-unpublish

Synopsis

```
<!-- AUTOGENERATED USAGE DESCRIPTIONS -->
```

To learn more about how the npm registry treats unpublish, see our [unpublish policies](https://docs.npmjs.com/policies/unpublish)

Warning

Consider using the deprecate command instead, if your intent is to encourage users to upgrade, or if you no longer want to maintain a package.

Description

This removes a package version from the registry, deleting its entry and removing the tarball.

The npm registry will return an error if you are not logged in.

If you do not specify a version or if you remove all of a package's versions then the registry will remove the root package entry entirely.

Even if you unpublish a package version, that specific name and version combination can never be reused. In order to publish the package again, you must use a new version number. If you unpublish the entire package, you may not publish any new versions of that package until 24 hours have

passed.
