\$ man pthread_create.3

pthread_create(3) Library Functions Manual pthread_create(3)

NAME

pthread_create - create a new thread

LIBRARY

POSIX threads library (libpthread, -lpthread)

SYNOPSIS

```
#include <pthread.h>

int pthread_create(pthread_t *restrict thread,
                   const pthread_attr_t * _Nullable restrict attr,
                   typeof(void *(void * _Nullable)) *start_routine,
                   void * _Nullable restrict arg);
```

DESCRIPTION

The `pthread_create()` function starts a new thread in the calling process. The new thread starts execution by invoking `start_routine()`; `arg` is passed as the sole argument of `start_routine()`.

The new thread terminates in one of the following ways:

- ? It calls `pthread_exit(3)`, specifying an exit status value that is available to another thread in the same process that calls `pthread_join(3)`.
- ? It returns from `start_routine()`. This is equivalent to calling `pthread_exit(3)` with the value supplied in the return statement.
- ? It is canceled (see `pthread_cancel(3)`).
- ? Any of the threads in the process calls `exit(3)`, or the main thread performs a return from `main()`. This causes the termination of all threads in the process.

The `attr` argument points to a `pthread_attr_t` structure whose contents are used at thread creation time to determine attributes for the new thread; this structure is initialized using `pthread_attr_init(3)` and related functions. If `attr` is `NULL`, then the thread is created with default attributes.

Before returning, a successful call to `pthread_create()` stores the ID of the new thread in the buffer pointed to by `thread`; this identifier is used to refer to the thread in subsequent calls to other pthreads functions.

The new thread inherits a copy of the creating thread's signal mask (`pthread_sigmask(3)`).

The set of pending signals for the new thread is empty (sigpending(2)). The new thread does not inherit the creating thread's alternate signal stack (sigaltstack(2)).

The new thread inherits the calling thread's floating-point environment (fenv(3)).

The initial value of the new thread's CPU-time clock is 0 (see `pthread_getcpuclockid(3)`).

Linux-specific details

The new thread inherits copies of the calling thread's capability sets (see `capabilities(7)`) and CPU affinity mask (see `sched_setaffinity(2)`).

RETURN VALUE

On success, `pthread_create()` returns 0; on error, it returns an error number, and the contents of `*thread` are undefined.

ERRORS

EAGAIN Insufficient resources to create another thread.

EAGAIN A system-imposed limit on the number of threads was encountered. There are a number of limits that may trigger this error: the RLIMIT_NPROC soft resource limit (set via `setrlimit(2)`), which limits the number of processes and threads for a real user ID, was reached; the kernel's system-wide limit on the number of processes and threads, `/proc/sys/kernel/threads-max`, was reached (see `proc(5)`); or the maximum number of PIDs, `/proc/sys/kernel/pid_max`, was reached (see `proc(5)`).

EINVAL Invalid settings in attr.

EPERM No permission to set the scheduling policy and parameters specified in attr.

ATTRIBUTES

For an explanation of the terms used in this section, see `attributes(7)`.

STANDARDS

POSIX.1-2008.

HISTORY

POSIX.1-2001.

NOTES

See `pthread_self(3)` for further information on the thread ID returned in `*thread` by `pthread_create()`. Unless real-time scheduling policies are being employed, after a call to `pthread_create()`, it is indeterminate which thread—the caller or the new thread—will next execute.

A thread may either be joinable or detached. If a thread is joinable, then another thread can call `pthread_join(3)` to wait for the thread to terminate and fetch its exit status.

Only when a terminated joinable thread has been joined are the last of its resources released back to the system. When a detached thread terminates, its resources are automatically released back to the system: it is not possible to join with the thread in order to obtain its exit status. Making a thread detached is useful for some types of daemon threads whose exit status the application does not need to care about. By default, a new thread is created in a joinable state, unless `attr` was set to create the thread in a detached state (using `pthread_attr_setdetachstate(3)`).

Under the NPTL threading implementation, if the `RLIMIT_STACK` soft resource limit at the time the program started has any value other than "unlimited", then it determines the default stack size of new threads. Using `pthread_attr_setstacksize(3)`, the stack size attribute can be explicitly set in the `attr` argument used to create a thread, in order to obtain a stack size other than the default. If the `RLIMIT_STACK` resource limit is set to "unlimited", a per-architecture value is used for the stack size: 2 MB on most architectures; 4 MB on POWER and Sparc-64.

BUGS

In the obsolete LinuxThreads implementation, each of the threads in a process has a different thread ID. This is in violation of the POSIX threads specification, and is the source of many other nonconformances to the standard; see pthreads(7).

EXAMPLES

The program below demonstrates the use of `pthread_create()`, as well as a number of other

functions in the pthreads API.

In the following run, on a system providing the NPTL threading implementation, the stack size defaults to the value given by the "stack size" resource limit:

```
$ ulimit -s
8192      # The stack size limit is 8 MB (0x800000 bytes)

$ ./a.out hola salut servus

Thread 1: top of stack near 0xb7dd03b8; argv_string=hola
Thread 2: top of stack near 0xb75cf3b8; argv_string=salut
Thread 3: top of stack near 0xb6dce3b8; argv_string=servus

Joined with thread 1; returned value was HOLA
Joined with thread 2; returned value was SALUT
Joined with thread 3; returned value was SERVUS
```

In the next run, the program explicitly sets a stack size of 1 MB (using `pthread_attr_set?stacksize(3)`) for the created threads:

```
$ ./a.out -s 0x100000 hola salut servus

Thread 1: top of stack near 0xb7d723b8; argv_string=hola
Thread 2: top of stack near 0xb7c713b8; argv_string=salut
Thread 3: top of stack near 0xb7b703b8; argv_string=servus

Joined with thread 1; returned value was HOLA
Joined with thread 2; returned value was SALUT
Joined with thread 3; returned value was SERVUS
```

Program source

```
#include <ctype.h>

#include <err.h>

#include <pthread.h>

#include <stdio.h>

#include <stdlib.h>

#include <string.h>

#include <sys/types.h>

#include <unistd.h>

struct thread_info { /* Used as argument to thread_start() */
    pthread_t thread_id; /* ID returned by pthread_create() */
    int thread_num; /* Application-defined thread # */
```

```

    char    *argv_string;    /* From command-line argument */
};

/* Thread start function: display address near top of our stack,
   and return upper-cased copy of argv_string. */
static void *
thread_start(void *arg)
{
    struct thread_info *tinfo = arg;

    char *uargv;

    printf("Thread %d: top of stack near %p; argv_string=%s\n",
           tinfo->thread_num, (void *) &tinfo, tinfo->argv_string);

    uargv = strdup(tinfo->argv_string);
    if (uargv == NULL)
        err(EXIT_FAILURE, "strdup");
    for (char *p = uargv; *p != '\0'; p++)
        *p = toupper(*p);

    return uargv;
}
