VALGRIND-DI-SERVER(1) valgrind-di-server VALGRIND-DI-SERVER(1)

NAME

valgrind-di-server - Experimental debuginfo server for valgrind

SYNOPSIS

valgrind-di-server [options]

DESCRIPTION

valgrind-di-server accepts (multiple) connections from valgrind processes that use the --debuginfo-server option on the specified port and serves (compressed) debuginfo files (in chunks) from the current working directory.

OPTIONS

-e --exit-at-zero

When the number of connected processes falls back to zero, exit. Without this, it will run forever, that is, until you send it Control-C.

--max-connect=INTEGER

By default, the server can connect to up to 50 processes. Occasionally, that number is too small. Use this option to provide a different limit. E.g. --max-connect=100.

portnumber

Changes the port it listens on from the default (1500). The specified port must be in the range 1024 to 65535. The same restriction applies to port numbers specified by the --debuginfo-server option to Valgrind itself.
