

XtSetArg(3)

## NAME

XtSetArg,

## SYNTAX

int XtSetA

ArgList Xt

## ARGUMENTS

*arg*

*args1*

*args2*

*num\_args1*      Specifies

*num\_args2*      Specifies

*name*            Specifies

*value*           Specifies the va

## DESCRIPTION

The **XtSetArg** function is usually used in a **Widget** function; for example:

Alternatively, an application can statically declare the argument list and use **XtNumber**:

Note that you should not use auto-increment or auto-decrement within the first argument to **XtSetArg**. **XtSetArg** can be implemented as a macro that dereferences the first argument twice.

The **XtMergeArgLists** function allocates enough storage to hold the combined **ArgList** structures and copies them into it. Note that it does not check for duplicate entries. When it is no longer needed, free the returned storage by using **XtFree**.
