

NAME

fsck.xfs – do nothing, successfully

SYNOPSIS

fsck.xfs [*filesystem ...*]

DESCRIPTION

fsck.xfs is called by the generic Linux **fsck**(8) program at startup to check and repair an XFS filesystem. XFS is a journaling filesystem and performs recovery at **mount**(8) time if necessary, so **fsck.xfs** simply exits with a zero exit status.

If you wish to check the consistency of an XFS filesystem, or repair a damaged or corrupt XFS filesystem, see **xfs_repair**(8).

However, the system administrator can force **fsck.xfs** to run **xfs_repair**(8) at boot time by creating a */forcefsck* file or booting the system with "fsck.mode=force" on the kernel command line.

FILES

/etc/fstab.
