

NAME

recountdiff – recompute patch counts and offsets

SYNOPSIS

recountdiff [*file...*]

recountdiff {[--help] | [--version]}

DESCRIPTION

recountdiff recomputes the counts and offsets in unified context diffs. It does this in two passes: first the counts are corrected by inspection of the actual patch lines, and then the offsets are adjusted according to the computed counts.

The corrected diff is sent to standard output.

OPTIONS

--help

Display a short usage message.

--version

Display the version number of recountdiff.

LIMITATIONS

There are some things that cannot be dealt with. If you have removed the first context line in a hunk, for example, there is no way for **recountdiff** to know that. For more precise fixing up, use **rediff**(1), which uses the original and modified diffs.

SEE ALSO
