

**NAME**

`showconsolefont` – Show the current EGA/VGA console screen font

**SYNOPSIS**

`showconsolefont [ -V | --version ] [ -v ] [ -i ] [ -C console ]`

**DESCRIPTION**

The `showconsolefont` command outputs the current console font to stdout. The option `-v` prints additional information, while the option `-V` prints the program version number. The option `-i` doesn't print out the font table, just shows ROWSxCOLSxCOUNT and exits. On Linux 2.6.1 and later, the option `-C` allows one to indicate the console involved. Its argument is a pathname.
