

NAME

xfs_scrub_all – scrub all mounted XFS filesystems

SYNOPSIS

xfs_scrub_all [**-hV**]

DESCRIPTION

xfs_scrub_all attempts to read and check all the metadata on all mounted XFS filesystems. The online scrub is performed via the **xfs_scrub** tool, either by running it directly or by using systemd to start it in a restricted fashion. Mounted filesystems are mapped to physical storage devices so that scrub operations can be run in parallel so long as no two scrubbers access the same device simultaneously.

OPTIONS

- h** Display help.
- V** Prints the version number and exits.

EXIT CODE

The exit code returned by **xfs_scrub_all** is the sum of the following conditions:

- 0 – No errors
- 4 – File system errors left uncorrected
- 8 – Operational error
- 16 – Usage or syntax error

These are the same error codes returned by **xfs_scrub**.

SEE ALSO

xfs_scrub(8).
